Summary

Defensive IO

Offensive IO

IO Definitions

(U) DoD defines IO as actions taken to affect adversary information and information systems while defending one's own information and information systems. Major capabilities to conduct IO include operational security (OPSEC), psychological operations (PSYOP), military deception, electronic warfare (EW), and physical attack/destruction and could include CNA. IO-related activities include public affairs and civil affairs activities. The two major subdivisions within IO are offensive IO and defensive IO.

- Offensive IO involve the integrated use of assigned and supporting capabilities and activities, mutually supported by intelligence, to affect adversary decisionmakers and achieve or promote specific objectives. Offensive IO capabilities and activities include OPSEC, military deception, PSYOP, EW, physical attack/destruction, and special information operations and could include CNA.

- Defensive IO integrate and coordinate policies and procedures, operations, personnel, and technology to protect and defend information and information systems. Defensive IO are conducted and assisted through Information Assurance, OPSEC, physical security, counterdeception, counterpropaganda, counterintelligence, EW, and sensitive IO. Defensive IO ensure timely, accurate, and relevant information access while denying adversaries the opportunity to exploit friendly information and information systems for their own purposes. Offensive IO can support defensive IO.
Callback Services

(U) Callback services allow a person in a foreign country to dial a designated US number and hang up after several rings. A computer attached to the US telephone then calls the foreign number and presents a US dial tone. The caller in the foreign country then dials the number of the party to whom he wishes to speak and is charged the US long-distance rate, not the rate set by the country from which he is calling.
Figure 2. (b) INMARSAT-M Telephone. INMARSAT, which began operations in 1982, operates a system of satellites to provide mobile communications services. INMARSAT-M provides mobile telecommunication services through a small portable terminal. The system is intended primarily for land-mobile use, although several maritime versions are available. A typical briefcase terminal includes a flat patch array antenna, weighs 18-35 pounds, and can operate off an external power source or a built-in battery for up to an hour.
Islamic Gateway and Hacker Groups

(U) Mohammed Al Mazari, head of the now-bankrupt Commission for the Defense of Legitimate Rights and current patron of the Islamic Gateway, is known for his ties to Bin Laden. In August 1996, for example, when Bin Laden issued a "Declaration of War" urging all Muslims to boycott US goods and join in armed struggle against the US military presence in the Persian Gulf, Al Mazari ordered dissemination of the Arabic-language document through the CDLR fax mailing list. Al Mazari also personally supervised the translation and distribution of an English language version of the declaration.

Islamic Gateway

(U) The Islamic Gateway is a web site dedicated to disseminating information on Islamic religious and political topics. The site is a professionally produced, extensive collection of Islamic information and news intended for a largely Western audience. Topics on the site include information on religious observances as well as Islamic militant movements and causes.
